JoomLeague Brand Manual

Complete brand ecosystem, platform, production and developer guide

FINAL v10 - Expanded EN/CZ edition

0. Manual scope

This document is the authoritative operational guide for using the JoomLeague identity across the complete v10 brand ecosystem. It covers visual identity, digital delivery, Joomla integration, developer packages, AI/Codex selection, production formats, release artwork, documentation assets, social channels and validation workflows.

Area	Purpose	Primary files
Identity	Logo, symbol, color system	logos/, icons/, developer/svg/
Digital	Favicons, Apple, Android, PWA, OS icons	favicons/, developer/linux/, developer/windows/, developer/macos/
Marketing	Social, YouTube, marketplace, release cards	social-media/, youtube/, marketplace/, releases/
Production	Print, CMYK, Pantone, signage, CNC	print/, production/
Developer	Tokens, components, packages, CLI	developer/
Governance	Validation and CI workflow	developer/tools/, .github/workflows/

1. Brand principle

JoomLeague is a sport-neutral brand for managing sports data, competitions and presentation inside Joomla. The identity must be recognizable in a sporting environment without showing any specific sport.

- Use competition-neutral ideas: trophy, shield, structure, victory, reliability.
- Do not use sport-specific imagery such as balls, players, jerseys, stadiums or equipment.
- The brand should work for football, basketball, hockey, motorsport, athletics and any other sport.
- When in doubt, choose abstract geometry, ribbons, gradients and the official symbol.

2. Identity architecture

The system is built from a primary wordmark, a standalone emblem, simplified UI symbols, platform icons, color tokens and structured usage metadata.

- Full logo: for official headers and high-visibility contexts.
- Standalone symbol: for square icons, apps and reduced spaces.
- Simplified SVGs: for Joomla menu, toolbar, small UI and CSS-colored icons.
- Design tokens: for repeatable UI and theming.

3. Logo usage

Use the supplied artwork. The wordmark is not a text composition and should not be recreated from a font.

- Do not stretch, skew, rotate, shadow or outline the logo manually.
- Do not crop the wordmark to make an icon.
- Use supplied dark/light variants to solve contrast.
- Keep a clear space around the logo; do not attach text or UI to it.

4. Color system

The approved color split is: Joom blue, Le green, ag orange, ue red. These four colors form the primary identity system.

- #0062A9 - brand blue / Joom segment / primary UI.
- #46B450 - green / Le segment / positive state.
- #F39C12 - orange / ag segment / advisory state.
- #E74C3C - red / ue segment / critical state.

5. Digital icon system

The pack contains favicon, Apple, Android, PWA, Windows, Linux and macOS assets. Each platform has its own size, masking and background expectations.

- Use SVG favicon first and ICO as fallback.
- Use Apple touch icon with an opaque safe background.
- Use maskable Android icons for adaptive launchers.
- Use platform-specific desktop containers for Windows and macOS.

Context	Asset	Reason
Small UI	developer/svg/joomleague-symbol-outline.svg	Readable at tiny sizes
App launcher	icons/joomleague-icon-simple-512x512.png	Square and clean
Dark background	developer/svg/joomleague-symbol-white.svg	High contrast
Light background	developer/svg/joomleague-symbol-blue.svg	Consistent brand blue

6. Joomla administration

Administration interfaces require clarity at small sizes. For menus and toolbar icons, use simplified currentColor or outline SVG, not the full glossy emblem.

- Menu icon: developer/svg/joomleague-symbol-currentcolor.svg.
- Toolbar icon: developer/svg/joomleague-symbol-outline.svg.
- Dashboard/about: full logo is acceptable.
- Respect Joomla light and dark admin themes.

Context	Asset	Reason
Small UI	developer/svg/joomleague-symbol-outline.svg	Readable at tiny sizes
App launcher	icons/joomleague-icon-simple-512x512.png	Square and clean
Dark background	developer/svg/joomleague-symbol-white.svg	High contrast
Light background	developer/svg/joomleague-symbol-blue.svg	Consistent brand blue

7. Developer assets

Developer assets are included so that JoomLeague branding can be consumed by CSS, SCSS, JavaScript, PHP/Composer, npm packages and automated agents.

- CSS tokens: developer/tokens/joomleague-tokens.css.
- Bootstrap variables: developer/bootstrap/_joomleague-bootstrap-variables.scss.
- SVG sprite: developer/svg-sprite/joomleague-icons.svg.
- Selector CLI: developer/cli/jl-asset.

Context	Asset	Reason
Small UI	developer/svg/joomleague-symbol-outline.svg	Readable at tiny sizes
App launcher	icons/joomleague-icon-simple-512x512.png	Square and clean
Dark background	developer/svg/joomleague-symbol-white.svg	High contrast
Light background	developer/svg/joomleague-symbol-blue.svg	Consistent brand blue

8. Marketing and release artwork

The v10 ecosystem contains repeatable, sport-neutral templates for social networks, YouTube, Discord/forum, Joomla marketplace, release announcements and documentation headers.

- Use release templates for Beta, RC, Stable and Dev versions.
- Use marketplace/JED assets for listing pages.
- Use documentation headers for docs and wiki pages.
- Keep social graphics abstract and non-sport-specific.

9. Print and production

Print production assets include CMYK TIFFs, Pantone reference guidance, bleed templates, monochrome assets, embroidery simplified vectors and laser/CNC/vinyl sources.

- CMYK and Pantone values are practical guides, not contractual color proofs.
- For embroidery and cutting, use simplified vectors without gradients.
- For one-color print, use monochrome assets.
- Always request a production proof for physical output.

10. AI/Codex governance

Codex should use metadata rather than guessing. The pack includes assets.json, ASSET_USAGE.md, VALIDATION_WORKFLOW.md and a CLI selector.

- Read developer/ai/assets.json first.
- Use developer/cli/jl-asset for context-based selection.
- Run validation before commits.
- Treat validation errors as blocking.

Context	Asset	Reason
Small UI	developer/svg/joomleague-symbol-outline.svg	Readable at tiny sizes
App launcher	icons/joomleague-icon-simple-512x512.png	Square and clean
Dark background	developer/svg/joomleague-symbol-white.svg	High contrast
Light background	developer/svg/joomleague-symbol-blue.svg	Consistent brand blue

11. Incorrect usage

Misuse weakens recognition and can break the sport-neutral promise. These rules apply to humans and automated agents.

- Do not add football, player or stadium imagery.
- Do not recolor the wordmark segments.
- Do not generate a new logo from scratch for official use.
- Do not ship unvalidated changed assets.

12. Validation and release readiness

The brand ecosystem includes local validation scripts, report generation and GitHub Actions workflow. A release-ready package must pass with zero errors.

- Run ./developer/tools/ci-validate.sh.
- Review validation-reports/validation-report.md.
- Fix broken references, size mismatches and invalid SVG/XML/JSON.
- Update assets.json when adding new deliverables.

Appendix A - Asset map

Folder	Purpose
brand/dark-mode	Dark optimized assets
brand/accessibility-high-contrast	High contrast assets
production/monochrome	One-color production
production/embroidery	Embroidery vectors
production/laser-cnc-vinyl	Cutting/engraving vectors
social-media	Network covers and posts
marketplace/joomla	JED and marketplace graphics
developer/cli	Codex selector CLI
developer/packages/npm	npm package scaffold
developer/packages/composer	Composer package scaffold

Appendix B - Command examples

```
./developer/cli/jl-asset joomla-menu --root .

./developer/tools/ci-validate.sh

python3 developer/tools/validate_brand_kit.py --report both
```

These examples are intended for Codex, CI and maintainers who need deterministic selection and validation.
